

## UNEMPLOYMENT, APRIL 1978 PRELIMINARY ESTIMATES

### INQUIRIES

*If you want to know more about these statistics ring Mr Godfrey Laurie, Canberra 526512 or our State office, or write to Information Services, ABS, P.O. Box 10, Belconnen, A.C.T. 2616*  
*For copies of this publication contact Information Services, Canberra 526627 or State offices.*

### MAIN FEATURES

**Note:** Survey estimates are subject to sampling variability, as explained in paragraphs 11 to 14 below. Standard errors of April 1978 estimates and of March to April movements are shown in the tables.

- Between March and April 1978 the number of unemployed persons is estimated to have decreased by 18,600 (6,400 males, 12,200 females).
- The number of unemployed persons looking for full-time work decreased by 11,400. 11,000 of this decrease was for persons aged 15-19 years.
- Unemployed persons looking for part-time work decreased by 7,200.
- In April 1978 an estimated 334,300 persons (196,600 males, 137,700 females) were unemployed, looking for full-time work, representing 6.2 per cent of the full-time labour force.
- 67,400 persons (14,600 males, 52,800 females) were unemployed, looking for part-time work (6.8 per cent of the part-time labour force).

### EXPLANATORY NOTES

#### Introduction

This bulletin contains preliminary unemployment estimates derived from the monthly population survey. Until February 1978, surveys were conducted in February, May, August and November each year. More detailed estimates are published in *The Labour Force (Preliminary)* (6202.0) and *The Labour Force* (6203.0).

#### The population survey

2. The survey is based on a multi-stage area sample of private dwellings (about 30,000 houses, flats, etc.) and non-private dwellings (hotels, motels, etc.), and covers about two-thirds of one per cent of the population of Australia. The information is obtained from the occupants of selected dwellings by carefully chosen and specially trained interviewers, the interviews generally being conducted during the two weeks beginning on the Monday between the 6th and 12th of each month. The information obtained relates to the week prior to the interview (i.e. the survey week).

Before February 1978 the interviews were spread over four weeks, chosen so that the survey weeks generally fell within the limits of the calendar month.

#### Definitions

3. For purposes of the survey, unemployed persons are those aged 15 years and over who were not employed during the survey week and :

- had actively looked for full-time or part-time work at any time in the four weeks up to the end of the survey week and :
  - were available for work in the survey week, or would have been available except for temporary illness (i.e. lasting for less than four weeks to the end of the survey week); or
  - were waiting to start a new job within four weeks from the end of the survey week and would have started in the survey week if the job had been available then; or
- were waiting to be called back to a full-time or part-time job from which they had been stood down without pay for less than four weeks up to the end of the survey week (including the whole of the survey week) for reasons other than bad weather or plant breakdown.

This definition of unemployed persons conforms closely to that recommended by the Eighth International Conference of Labour Statisticians (1954).

4. *Unemployed persons looking for first job* are those who had never worked for two weeks or more in a full-time job.

#### Revision of series

5. Because the estimates for February 1978 and subsequent months are based on revised population estimates derived from the results of the 1976 Population Census and were obtained by using a revised sample and revised questionnaire, they are not comparable with those in issues of this publication prior to February 1978.

6. In order to provide estimates for earlier periods as comparable as possible with those on the new basis, the unemployment estimates for August 1976 to November 1977 were revised. Information concerning the methods used in the revision was given in the February 1978 issue of this publication.

### Population benchmarks

7. The population survey estimates are calculated in such a way as to conform to the independently estimated distribution of the population by age and sex. As a consequence, whenever these population "benchmarks" are revised it becomes necessary to revise the labour force estimates also.

8. The survey estimates for the period from August 1976 are based on population benchmarks derived from the results of the 1976 Population Census, adjusted for underenumeration. For information concerning these population estimates see *Population and Vital Statistics (Preliminary) : December Quarter 1976* (3211.0).

### The revised sample and revised questionnaire

9. The revised sample was selected in order to reflect the changes in the distribution of the population shown by the 1976 Population Census results. The questionnaire, which had undergone little change since 1960 except for the inclusion in 1975 of additional questions on job-seeking, was revised to provide more accurate and more detailed information concerning the labour force.

10. Copies of both the current questionnaire and the one previously used, together with a description of the main features of the questionnaire, are contained in *Information Paper : Questionnaires used in the Labour Force Survey* (6232.0) issued on 17 March 1978.

### Comparability of series

11. When comparing unemployment estimates for February 1978 and subsequent months with those for earlier periods it should be noted that with the introduction of monthly surveys the interviews are now conducted during a two-week period, whereas formerly the period was four weeks. (See paragraph 2.) This change of timing may affect the level of the figures for any month, but particularly for months such as February, during which unemployment may be changing rapidly.

### Reliability of the estimates

12. Since the estimates in this publication are based on information obtained from occupants of a sample of dwellings they, and the movements derived from them, are subject to sampling variability; that is, they may differ from the figures that would have been produced if all dwellings had been included in the survey. One measure of the likely difference is given by the *standard error*, which indicates the extent to which an estimate might have varied by chance because only a sample of dwellings was included in the survey. There are about two chances in three that a sample estimate will differ by less than one standard error from the figure that would have been obtained if all dwellings had been included in the survey, and about nineteen chances in twenty that the difference will be less than two standard errors.

13. Standard errors of unemployment estimates for the latest month and of estimates of movements since the previous month are contained in the tables. Examples of the use of these two sets of standard errors are given below.

- (a) The estimate of 334,300 unemployed persons looking for full-time work in April 1978 has a standard error of about 5,200, and therefore there are about two chances in three that the value that would have been produced if all dwellings had been included in the survey will fall within the range 329,100 to 339,500 and about nineteen chances in twenty that the value will fall within the range 323,900 to 344,700.
- (b) The estimate of movement in the number of unemployed persons looking for full-time work from March to April 1978 is a decrease of 11,400. The standard error of this estimate of movement is about 4,200 and therefore there are about two chances in three that if all dwellings had been included in the surveys the decrease would have been within the range 7,200 to 15,600 and about nineteen chances in twenty that it would have been within the range 3,000 to 19,800.

14. Further details of the sampling variability of the estimates and of monthly movements were published in the March 1978 issue of *The Labour Force (Preliminary)* (6202.0). Details of standard errors of quarterly movements can be obtained from the Technical Note included in the November 1977 issue of *The Labour Force* (6203.0).

### Seasonally adjusted estimates

15. As explained in previous issues of this publication, the move to the higher level of unemployment since 1974 appears to have been accompanied by shifts in the pattern of seasonal variation. For this reason the publication of seasonally adjusted quarterly figures of unemployment has been suspended. The matter will be kept under review. Calculation of seasonally adjusted monthly figures will not be possible until results for two or three years are available.

### Comparability with Commonwealth Employment Service figures

16. The survey estimates of unemployed persons looking for full-time work may differ from the number of persons registered with the Commonwealth Employment Service (CES) as not employed, awaiting placement in full-time employment, for a number of reasons, including the following :

- (a) the survey estimates include some unemployed persons (particularly females) who did not register with the CES

- (b) they exclude persons who worked for one hour or more during the survey week, although they may have been registered with the CES — for example because they became unemployed during the week or worked for only short periods
- (c) they exclude persons registered as unemployed who found jobs or who were no longer looking for work but did not notify the CES of their changed situation
- (d) they represent averages over a period (see paragraph 2), whereas the CES figures refer to numbers registered on the Friday nearest the end of the month. This is particularly important at times when there are substantial rises or falls in unemployment or in registrations with the CES
- (e) they are subject to sampling variability. (See paragraphs 12 to 14.)

#### Related Publications

17. Users may also wish to refer to the following publications which are available on request :

*The Labour Force (Preliminary)* (6202.0)  
*The Labour Force* (6203.0)  
*Information Paper : Questionnaires used in the Labour Force Survey* (6232.0)  
*Job Vacancies* (6218.0) and (6231.0).

All publications produced by the ABS are listed in *Catalogue of Publications 1977* (1101.0), which is available free of charge from any ABS office.

NOTE. Any discrepancies between totals and sums of components in the tables are due to rounding.
